

STIL Orthosis

Stabilizes the hands of people with essential tremors

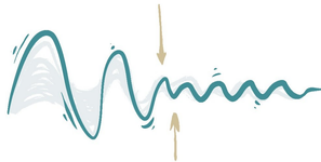

STIL anti-tremor orthosis

The STIL Orthosis is a CE-certified device that suppresses essential tremors. The orthosis adds artificial damping to the joints of the forearm. As a result, faster movements (i.e., tremors) are damped, while voluntary motion is preserved.

The orthosis is a non-invasive, lightweight (315gr) medical device that can be worn under clothing.

Clinically proven

A randomized crossover trial has shown that the STIL Orthosis significantly reduces tremors for people with essential tremor. Moreover, participants experienced only minor side effects. Investigations on how the STIL Orthosis can benefit people with Parkinson's Disease and other disorders are currently in progress.

Try-out with a patient

The STIL Orthosis is currently available in the Netherlands, and we aim to roll-out to other countries in the coming years.

Do you encounter tremor patients for whom medication is not sufficient, and interested in trying out the orthosis?
